TITLE: Ornithosis in the western oblasts of the Ukraine

SOURCE: Zhurnal mikrobiologii, epidemiologii i immunobiologii, no. 3, 1966, 154-155

TOPIC TAGS: epidemiology, animal disease, man, respiratory system disease, diagnostic medicine

ABSTRACT: Ornithosis has been rarely diagnosed in the western oblasts of the Ukraine, L'vovskaya Oblast in particular, mainly because the symptoms resemble pneumonia and other diseases. Over a period of 3 years the authors examined 281 persons, 247 with different diseases and 34 healthy workers in a meat-packing plant. Thirty-eight reacted positively to a skin test, including 28 sick and 10 healthy persons. Eight of the sick persons were diagnosed as having pneumonia or other respiratory diseases. Six times more females than males reacted positively, apparently, according to the authors, because they have more contact in their daily lives with poultry. In addition, four and one-half times more positive reactions were noted in those who had occupational contact with poultry than in those with other jobs. The authors conclude that ornithosis is present in L'vovskaya Oblast (both in symptomatic and in asymptomatic forms) but is misdiagnosed. They recommend the use of the skin test for retrospective diagnosis within a year after the individual contracted the disease. [JPRS]

TITLE: On the Transformation Mechanism of Tertiary Alcohols of the Cyclopropane Series Under the Influence of Mineral and Organic Acids. VII. Methyl Cyclopropyl Phenylacetylenyl Carbinol and Methyl Cyclopropyl Acetyl Carbinol and Their Stability in Acid Medium

PERIODICAL: Zhurnal obshchey khimii, 1959, Vol 29, Nr 9, pp 2894-2899 (USSR)

ABSTRACT: It was of interest to find out how methyl cyclopropyl phenyl acetylenyl carbinol, a cyclic alcohol with substituted acetylene hydrogen, reacts with sulphuric and hydrochloric acid. A related problem was the hydration of methyl cyclopropyl acetylenyl carbinol and the properties of the methyl cyclopropyl acetyl carbinol resulting in this connection. Methyl cyclopropyl phenyl acetylenyl carbinol (I) was synthesized and identified according to A. Ye. Favorskiy (Ref 7) from phenyl acetylene and acetyl trimethylene in the presence of caustic potash and over the organomagnesium compound. When heated with hydrochloric acid (1:10), methyl cyclopropyl phenyl acetylenyl carbinol (I) was found to be yielded back unchanged from the reaction. On reaction with diluted hydrochloric acid (1:1), methyl cyclo-

propyl phenylacetylenyl carbinol forms a cyclic chloride, methyl cyclopropyl phenylacetylenyl chloro methane (II) (Scheme 1). The authors investigated the hydration of methyl cyclopropyl acetylenyl carbinol (IV), and found the resulting methyl cyclopropyl acetyl carbinol (V) to be stable in acid medium at room temperature. The investigation further revealed that, when distilling the hydration products of methyl cyclopropyl acetylenyl carbinol with steam, the result is an isomerization of methyl cyclopropyl acetyl carbinol in the unsaturated ketoalcohol 3-methyl hexen-3-on-2-ol (VI) (Scheme 2) with subsequent cleavage, under the formation of acetyl trimethylene. The structure of compound (VI) was confirmed by spectroscopic analysis. There are 10 references, 8 of which are Soviet.

TITLE: To Increase the Role of the Production Laboratories in the Improvement, Automation and Mechanization of the Means of Communications

PERIODICAL: Vestnik svyazi, 1959, Nr 8, pp 25-26 (USSR)

ABSTRACT: This article deals with the work of the production laboratories of the communications industry in the USSR. The authors first review some recent work at a number of these laboratories. Work done at the Sverdlovsk Central Telegraph Office by A. G. Vasilevskiy, A. D. Rivkina and L. P. Mitrofanova on group servicing of telegraph facilities (see "Vestnik svyazi", 1959, Nr 5), which was found to increase productivity of labor of the telegraphists by 20%, is mentioned. Automation of transit telephone call processing is discussed: Workers at the Leningrad inter-city telephone station (MTS) have developed a project for complete automation of inter-city telephone communication for their province, outlined in the text. Also

Card 1/5

SOV/111-59-8-21/30

To Increase the Role of the Production Laboratories in the Improvement, Automation and Mechanization of the Means of Communications

mentioned is work done at the laboratory of the Leningrad Telegraph Office on improving the TT-ChM-12/16 acoustical telegraph apparatus, and work at the laboratory of the Khabarovsk MTS on improving operational stability of the acoustical telegraph channels in the MYe-8 eight-channel system. Improvements in the OKS apparatus were made at the laboratory of the Saratov MTS; the receiver and tone generator were returned to a frequency of 2,100 cps. Last year, it is stated, production laboratory developments were widely introduced at MTS and telegraph offices in the RSFSR: pneumatic "post" systems, developed by the laboratories of the Rostov and Saratov MTSSs, for transmission of order blanks; a method of servicing telegraphic facilities without transmission control, developed at the laboratory of the Leningrad Central Telegraph Office, which freed up to 60 ST-35 apparatuses. The authors criticize several production laboratories for lack of attention to their proper functions, particularly those of the Irkutsk and Saratov

Card 2/5

SOV/111-59-8-21/30

To Increase the Role of the Production Laboratories in the Improvement, Automation and Mechanization of the Means of Communications

MTS and the Gor'kiy and Khabarovsk Telegraph Offices. Insufficient attention, they state, is paid to developing new methods of servicing telephone and telegraph facilities, in keeping up with new equipment and techniques. Further criticism is levelled at the laboratories of the Khabarovsk, Rostov and Kuybyshev MTS for lack of attention to measures for increasing utilization of telephone channels. The chief engineers of the Novosibirsk MTS (Sveshnikov), the Gor'kiy Telegraph Office (Popov), and the Irkutsk Telegraph Office (Glazer) are criticized for not reinforcing the staffs of their laboratories with qualified personnel. Exchange of information between production laboratories took place last year through distribution of accounts of their work and exchanges of visits; representatives of the Leningrad, Kuybyshev, Sverdlovsk, Kalinin and Stalingrad MTS visited the Saratov MTS, and representatives of the latter visited the Leningrad and Riga MTS; Laboratory workers of the Gor'kiy Telegraph Office visited the laboratory

Card 3/5

SCV/111-59-8-21/30

To Increase the Role of the Production Laboratories in the Improvement, Automation and Mechanization of the Means of Communications

of the Kiyev Telegraph Office. The authors report that a conference of laboratory workers at the telegraph offices and MTS was conducted by the Ministry of Communications for the purpose of summing up the work of the past year, determination of tasks for the coming year, and coordination of the activities of the laboratories. The authors outline many of the tasks facing the production laboratories in the development of new service methods, automation and mechanization, and improvement of quality and reliability of operation of communications facilities. In conclusion the authors note that in view of the important role of the production laboratories in achieving technical progress and implementing automation and mechanization of production processes, supplementary organization of production laboratories at MTS and telegraph offices in a number of cities in the RSFSR is projected. G. A. Shchekin, Engineer at the Leningrad Telegraph Office is mentioned (photograph caption). There is 1 photograph.

SOV-111-58-10-15/29

TITLE: ~~Experience of Executing Orders for Transit Calls Outside~~
the Schedule in Interurban Telephone Stations (Opyt vypol-
neniya zakazov na tranzitnyye razgovory vne raspisaniya na
mezhdugorodnykh telefonnykh stantsiyakh)

PERIODICAL: Vestnik svyazi, 1958, Nr 10, pp 20-22 (USSR)

ABSTRACT: Several new transit stations have been established which
permit calls without use of the Moscow transit station. The
number of calls in the RSFSR had therefore increased by 26.5%
in June 1958 as compared with the same month in 1956. In
the Russian Federation, transit junctions have been organ-
ized in Leningrad, Kuybyshev, Chelyabinsk, Rostov, the
junction in Novosibirsk being not yet completed. Over-
crowded lines use a timetable system for telephone calls
in order to switch part of the calls to less busy hours.
At the Leningrad junction, 14% of all calls are handled by
automatic equipment. The loss of time during the connection
of two numbers is considerable. For the line Kuybyshev -
Khar'kov, 9 minutes are needed; for Kuybyshev - Rostov, 4
minutes 40 seconds, etc. The waiting time for a call is
1 -2 hours in 4.6% of all cases, and more than 2 hours in

TITLE: A high-voltage pulse capacitor. Class 21, No. 190996 [announced by the Capacitor Design Branch of the All-Union "Order of Lenin" Electrical Engineering Institute im. V. I. Lenin (Filial po kondensatorostroyeniyu Vsesoyuznogo ordena Lenina elektrotekhnicheskogo instituta)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 3, 1967, 56

TOPIC TAGS: electric capacitor, pulse signal

ABSTRACT: This Author's Certificate introduces a high-voltage pulse capacitor equipped with insulating layers made from paper saturated with a liquid dielectric and plates of aluminum foil. The capacitor is made in the form of packets which are electrically and mechanically interconnected. These packets consist of plane-parallel pressed sections with the higher-potential sections located in the middle of the packet and the lower-potential sections at the ends. The leads are connected to accumulator buses. The capacitor is designed for reduced inductance with a simultaneous simplification of production technology. The high-voltage bus is parallel to the end surfaces of the section packets and has holes for passage of the packet taps connected to this bus

Card 1/2

AUTHOR: Titov, N. A.

TITLE: Work experience with endothermic atmospheres

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 5, 1962, 134, abstract 51810
("Tr. Proyechn., tekhnol. i n.-i. in-ta. Gor'kovsk. sovnarkhoz",
1960, no. 3(5), 72 - 83)

TEXT: The endothermic atmosphere is the most prospective one in the technology of thermal treatment, since it may be simply and cheaply produced and may be utilized for the thermal treatment of various grades of steels. The endothermic atmosphere is obtained by means of cracking saturated hydrocarbon gases (natural gas and reduced propane-butane mixtures) in the presence of a fixed and strictly controllable quantity of air. Considered are the methods of obtaining endothermic atmosphere. When obtaining endothermic atmosphere which is controllable by the carbon potential and used for the thermal treatment of a steel with 0.2 - 2% C, the excess air $\alpha = 0.25 - 0.35$. For natural gas $\alpha = 0.25 - 0.30$, and for propane-butane mixtures - $\alpha = 0.30 - 0.35$. Endothermic atmosphere

with additions of unprocessed hydrocarbon gas is used for gas cementation, and with additions of NH_3 - for gas cyanidation. A description is given of a new setup of an installation for evaporating liquefied propane-butane mixtures, which should be used for producing 40 - 50 m^3 of endothermic atmosphere per hour, or 80 - 100 m^3 of exothermic atmosphere per hour. A two-side regulation system was developed and used. A diagram of the system is presented. A method of changing the air-gas ratio made it possible to eliminate the use of a compressor with an electric motor which is being utilized in conventional schemes with position-type regulation of the carbon potential. In the pickup of the device which determines the dew point of the atmosphere, silver electrodes may be fully used instead of gold and platinum ones. Controllable atmospheres, obtained in an endothermic generator, may also be used for thermal treatment at 500 - 700°C with $\alpha = 0.35 - 0.45$. There are 7 references.

<p>Replacement of Cobalt by Nickel in Pressed Hard Alloys. V. I. Tretjakov and N. D. Titov (<i>Rodkie Metally (Rare Metals)</i>, 1934, (1), 24-26).—[In Russian.] The preparation of "Pobedit" with nickel instead of cobalt is described. A mixture of tungsten carbide and zinc dust is shaken with an ammoniacal solution of a nickel salt, and after precipitation of nickel is complete, the metallic residue is washed with water and alcohol and dried. Sintering is effected in the absence of carbon. The alloy containing 8% of nickel has a Rockwell C hardness of 80. A cutting tool of such an alloy, when used for the turning of carbon steel (Brinell hardness 150) making a shaving of 3-4 mm. cross-section at a speed of 110 m./minute, was blunted after 3-5 minutes and at a speed of 90 m./minute after 13-25 minutes. The alloy is tough and does not crumble.—D. N. B.</p>

Desulfurization of cast iron with a mixture of thermite with calcined soda, lime and potassium permanganate. N. D. Titov. *Lifeline Deo* 1940, No. 8-9, 14-15.—Best desulfurizers are: (1) calcined soda and lime and (2) calcined soda, thermite and lime. The dosage of the first mixt. is 6-7 kg. soda and 3-4 kg. lime per ton of liquid cast Fe; the second, 6-7 kg. soda, 3-4 kg. lime and 10-12 kg. thermite.

4907. MINERAL COMPOSITION OF PEAT WATER AND ITS RELATION TO SOME PROPERTIES OF PEAT. Titov, N.C. and Zharkova, A.V. (Izvest. Akad. Nauk SSSR, Otdel. Tekh. Nauk (Bull. Acad. Sci. U.S.S.R., Sect. Tech. Sci.), 1948, 643-648: abstr., 1951, vol.45, 5389). The composition of peat was shown to depend on the mineral content of the water in the peat bogs. With high gypsum concentration of the water, peat had low bitumen and high ash content, while with low gypsum concentration the reverse was true. This accounted for by the presence of Ca humates in the high ash peat. C.A.

"Litey Proiz" No 2, pp 13, 14

Essential advantages of malleable iron with addn of titanium are increased plasticity, possibility of straightening parts in presses and better machinability than spheroidized manganese cast iron. Addn of 0.05-0.06% Ti is sufficient with Mn-content of 1.0-1.2%. Also examd effect of Mg-addn on properties of perlitic malleable iron.

Electric Spark Hardening of Metallic Articles. G. P. Ivanov
and N. D. Tilov. (*Litinskiy Proizvodstvo*, 1953, 3, 1, 21-22).
(In Russian). The Ivanov electric metallizing machine and
its use for depositing hard materials on steel or cast iron sur-
faces are described. From a primary voltage of 220 a pulsat-
ing and adjustable secondary voltage produces a spark which
carries particles of the hard material (anode) on to the article
(cathode). The hardness of the deposited layer is enhanced
by the nitriding of the particles as they pass through atmos-
pheric nitrogen, ionized by the spark. The high temperature
of the spark also favours diffusion and leads to firm adhesion
of the deposited layer. Photomicrographs of treated surfaces
are shown.—S. K.

Sponsoring Agency: Kommunisticheskaya partiya Sovetskogo Soyuza. Vysshaya partiynaya shkola. Kafedra promyshlennogo proizvodstva i stroitel'stva.

Eds.: G.I. Pogodin-Alekseyev, A.G. Kokoshko, and D.R. Beyzel'man; Tech. Ed.: K. M. Naumov.

PURPOSE: This textbook is intended for students of higher party schools.

COVERAGE: The book deals with manufacturing processes in the machine industry. Rolling, drawing, pressing, forging, and stamping of metals are discussed in Part I, founding in Part II, welding and gas cutting in Part III, and metal cutting in Part IV. No personalities are mentioned. There are no references.
